

- You can use any **OpenVPN** app to connect but we recommend **OpenVPN Client** app itself (download link below).
- Try NOT to use this on Mobile **Android** phone because it's likely your IP gets blocked by some websites and apps.
- You can use your account on **multiple** devices and at the **same time**.

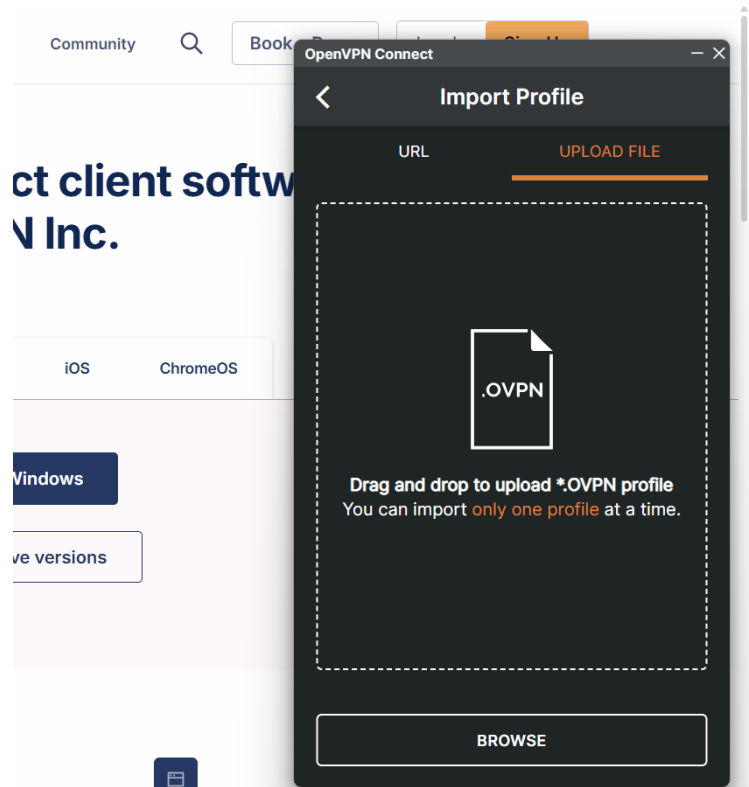

1. Download & Installation

<https://openvpn.net/client/>

2. Add/import Profile

Go to **"Upload File"** tab and upload the **".ovpn"** file sent to you in Telegram PV

3. Enter your account information

After uploading the file, you will see this page and can enter your credentials here:

- Username: [sent in Telegram PV]
- Password: [sent in Telegram PV]
- Private/Secret Key: 123456789

The screenshot shows the 'OpenVPN Connect' application interface. The main window is titled 'Imported Profile' and contains the following fields and options:

- Profile Name:** 185.63.113.199 [TorontoVPS-Iran]
- Server Hostname (locked):** 185.63.113.199
- Username:** (empty field)
- ☒ **Save password**
- Password:** (empty field with an eye icon for toggling visibility)
- ☒ **Save Private Key Password**
- Private Key Password:** 12345678 (with an eye icon for toggling visibility)

At the bottom of the app window, there are two buttons: 'PROFILES' (white) and 'CONNECT' (orange).

The background shows a website with the following visible text: 'community', 'Book', 'client software', 'IC.', 'OS', 'ChromeOS', 'ons', and a small icon at the bottom left.

You can turn on the **Kill Switch** (block internet while VPN is paused or reconnecting), in the settings:
